

For Immediate Release

**Major European Telecommunications Vendor to Offer
Telrad's Commatch as Part of its WiMAX Solutions**

*Commatch provides a media gateway between existing legacy
switches and WiMAX deployments*

Lod, Israel – May 28, 2007 - Telrad Networks announced today that its Commatch 6004 product has been included into the WiMAX products catalogue offerings of a major Tier-1 telecommunications equipment vendor. The featured product, which supports voice over WiMAX through existing legacy switches, allows immediate implementation of voice and voice related services, providing an inexpensive WiMAX VoIP solution with seamless interoperability.

Commatch 6004 eliminates the need for a softswitch for call handling in VoIP deployments by providing a SIP to V5.2 gateway platform that transfers voice signaling as well as services such as call waiting, caller ID, fax, and other services. The solution is particularly appealing in rural areas, where cost is a major issue, and in initial WiMAX deployments, where the upgrade to a softswitch is planned in the future but an interim solution is required.

"Deploying a new access network is a complex undertaking," says Meir Bass, CTO of Telrad Networks. "Typically operators want to first make sure the WiMAX and IP networks are working before putting in a softswitch. Commatch provides an ideal solution for transition to next generation networks, preserving investment in existing TDM voice switches, and providing immediate voice over WiMAX service."

Commatch 6004 has been accepted by the European telecommunications vendor as part of its standard offering, following successful field trials and live implementations. The product allows the vendor to widen the scope of its offering for a large range of customers, ensuring the best possible WiMAX deployments, fit for different market needs.

**Telrad's WiMAX Solutions are featured at WiMAX World Europe Expo, Vienna,
May 29-31, 2007, at Booth 508**

ABOUT TELRAD NETWORKS LTD.: Telrad Networks has been developing carrier-grade communications equipment for more than half a century. Telrad provides development capabilities that focus on integration of core technologies into standardized, Tier-1 carrier-class products. Telrad is devoted to providing a highly flexible development team, allowing its partners and customers a high level of control in the development cycle and product roadmap. Telrad is a privately-owned company founded in 1951. For more information, visit www.telrad.com
